(54) Title: MLK RECEPTOR TYROSINE KINASES

(57) Abstract

Polynucleotides encoding novel receptor tyrosine kinases designated "mlk" are disclosed. mlk proteins and methods for their production, ligands for the mlk receptor and methods for their identification, and inhibitors of binding of mlk and its ligands and methods for their identification are also disclosed.

MLK RECEPTOR TYROSINE KINASES

This application is a continuation-in-part of application Ser. No. 08/277,803, filed

July 20, 1994.

5

Field of the Invention

The present invention relates to receptor tyrosine kinases, nucleic acids encoding such proteins, ligands thereto and methods of identifying inhibitors of activity of such proteins.

10 Background of the Invention

The receptors for almost all of the growth factors of biological interest belong to the tyrosine kinase or hematopoietin receptor families. Receptor tyrosine kinases (RTKs) include the receptors for M-CSF, kit ligand, neurotrophins and fibroblast growth factors. RTKs typically act as the first link in the chain of a responder cell which leads to biological effects of 15 various growth factors. Ligand binding to the extracellular region of the RTK leads to activation of its intracellular kinase domain and autophosphorylation of tyrosine residues. This phosphorylation causes a cascade of other cellular events which ultimately result in exhibition of the activity caused by the ligand. See generally, Yarden et al., Ann. Rev. Biochem., 1988, 57, 443; Bolen et al., Advances in Cancer Res., 1991, 57, 103; Fantl et al., Annu. Rev. 20 Biochem., 1993, 62, 453; Schlesinger et al., Neuron, 1992, 9, 383.

Because of their crucial position in the chain of events leading to the manifestation of biological activity, RTKs have recently been the subject of extensive study. Several RTKs have already been identified and, in many instances, cloned. Identified RTKs include: flt1

(deVries et al., *Science*, 1992, 255, 989); flt4 (Pajusola et al., *Cancer Res.*, 1992, 52, 5738); flk1 and flk2 (U.S. Patent Nos. 5,270,458, 5,185,438; WO93/10136; WO92/17486; WO93/00349; Matthews et al., *Cell*, 1991, 65, 1143; Rosnet et al., *Oncogene*, 1991, 6, 1641); RYK (WO93/23429); KDR (WO92/14748); tie (*WO93/14124*); *Torpedo californica* RTK (Jennings et al., *Proc. Natl. Acad. Sci. USA*, 1993, 90, 2895); tyro10 (Lai et al., *Oncogene*, 1994, 9, 877); ptk3 (Sanchez et al., *Proc. Natl. Acad. Sci. USA*, 1991, 88, 1819); trkb (Middlemas et al., *Mol. Cell Biol.*, 1991, 11, 143); and HEK (Wicks et al., *Proc. Natl. Acad. Sci. USA*, 1992, 89, 1611).

Some RTKs are differentially expressed in different tissues. For example, flk2 has been reported to be expressed in primitive hematopoietic cells, but not in mature hematopoietic cells. Thus, the differential expression of certain RTKs in a given tissue type may indicate a function for that RTK which is specific to such tissue. As a result, identification of tissue-specific RTKs may lead to the identification of RTKs involved in tissue-specific processes, and subsequently the ligands responsible for activating these tissue-specific processes. Therefore, it would be desirable to identify other tissue-specific RTKs to determine their relationship to tissue-specific functions.

Summary of the Invention

In accordance with the present invention, polynucleotides encoding novel RTKs are disclosed. The novel RTKs have been designated "muscle-localized kinase" or "mlk". "mlk" is used throughout the present specification to refer to both receptor proteins and polynucleotides encoding those proteins and to refer to proteins and polynucleotides from all

mammalian species.

In certain embodiments, the present invention provides for an isolated polynucleotide comprising a nucleotide sequence selected from the group consisting of: (a) the nucleotide sequence of SEQ ID NO:1 from nucleotide 13 to nucleotide 1602; (b) the nucleotide sequence of SEQ ID NO:18 from nucleotide 1 to nucleotide 2580; (c) the nucleotide sequence of SEQ ID NO:20 from nucleotide 1 to nucleotide 2604; (d) a nucleotide sequence capable of hybridizing to a nucleic acid sequence specified in (a)-(c); (e) a nucleotide sequence varying from the sequence of a nucleotide sequence specified in (a)-(c) as a result of degeneracy of the genetic code; and (f) an allelic variant of a nucleotide sequence specified in (a)-(c). In particular embodiments, the nucleotide sequence encodes for protein having mlk receptor activity and/or mlk ligand binding activity. Polynucleotides encoding various mammalian mlk proteins (including murine and human mlk proteins) are included in the present invention. In other embodiments, the nucleotide sequence is operably linked to an expression control sequence.

The present invention also encompasses host cells transformed with the polynucleotide of the invention, including mammalian cells.

In other embodiments, the invention provides for a process for producing a mlk protein, said process comprising: (a) growing a culture of host cells transformed with a polynucleotide of the invention in a suitable culture medium; and (b) purifying the mlk protein from the culture. mlk protein produced by such methods is also provided by the present invention.

Further embodiments of the present invention provide isolated mlk protein comprising an amino acid sequence selected from the group consisting of: (a) the amino acid

sequence of SEQ ID NO:2; (b) the amino acid sequence of SEQ ID NO:2 from amino acids 1 to 156; (c) the amino acid sequence of SEQ ID NO:2 from amino acids 157 to 177; (d) the amino acid sequence of SEQ ID NO:2 from amino acids 178 to 530; (e) the amino acid sequence of SEQ ID NO:2 from amino acids 242 to 517; (f) the amino acid sequence of SEQ ID NO:15; 5 (g) the amino acid sequence of SEQ ID NO:15 from amino acids 22 to 478; (h) the amino acid sequence of SEQ ID NO:19; (i) the amino acid sequence of SEQ ID NO:19 from amino acids 22 to 486; (j) the amino acid sequence of SEQ ID NO:19 from amino acids 487 to 507; (k) the amino acid sequence of SEQ ID NO:19 from amino acids 508 to 860; (l) the amino acid sequence of SEQ ID NO:19 from amino acids 572 to 847; (m) the amino acid sequence of SEQ 10 ID NO:21; (n) the amino acid sequence of SEQ ID NO:21 from amino acids 22 to 494; (o) the amino acid sequence of SEQ ID NO:21 from amino acids 495 to 515; (p) the amino acid sequence of SEQ ID NO:21 from amino acids 516 to 868; (q) the amino acid sequence of SEQ ID NO:21 from amino acids 580 to 855; (r) fragments of (a)-(q) having mlk receptor activity; and (s) fragments of (a)-(q) having mlk ligand binding activity. Pharmaceutical compositions 15 comprising mlk protein and a pharmaceutically acceptable carrier are also contemplated by the present invention, as are compositions comprising antibodies (polyclonal and monoclonal) which specifically react with mlk protein. Polynucleotides encoding each of these proteins are also provided by the present invention.

The present invention also encompasses methods of identifying a mlk receptor 20 ligand, said method comprising: (a) providing a sample containing a potential source of mlk ligand; (b) contacting said sample with a protein having mlk receptor activity or mlk ligand binding activity; and (c) collecting materials binding to the protein. mlk receptor ligands

**NOT TO BE TAKEN INTO CONSIDERATION FOR THE PURPOSES
OF INTERNATIONAL PROCESSING**

**NOT TO BE TAKEN INTO CONSIDERATION FOR THE PURPOSES
OF INTERNATIONAL PROCESSING**

These corresponding polynucleotide fragments are also part of the present invention. Modified polynucleotides as described above may be made by standard molecular biology techniques, including site-directed mutagenesis methods which are known in the art or by the polymerase chain reaction using appropriate oligonucleotide primers.

For the purposes of the present invention, a protein has "mlk receptor activity" when binding of a ligand to such protein results in tyrosine phosphorylation as measured by the tyrosine phosphorylation assay described below or other suitable assays. A protein has "mlk ligand binding activity" when it binds mlk ligand as measured by the ligand binding assay described below or other suitable assays.

mlk protein or fragments thereof having mlk ligand binding activity may be fused to carrier molecules such as immunoglobulins. For example, soluble forms of the mlk protein such as those fragments comprising amino acids 1-125 of SEQ ID NO:2 may be fused through "linker" sequences to the Fc portion of an immunoglobulin.

The invention also encompasses allelic variations of the nucleotide sequence as set forth in SEQ ID NO:1, that is, naturally-occurring alternative forms of the isolated polynucleotide of SEQ ID NO:1 which also encode proteins having mlk receptor activity or mlk ligand binding activity. Also included in the invention are isolated polynucleotides which hybridize to the nucleotide sequence set forth in SEQ ID NO:1 under highly stringent (0.2xSSC at 65°C), stringent (e.g. 4xSSC at 65°C or 50% formamide and 4xSSC at 42°C), or relaxed (4xSSC at 50°C or 30-40% formamide at 42°C) conditions. Isolated polynucleotides which encode mlk protein but which differ from the nucleotide sequence set forth in SEQ ID NO:1 by virtue of the degeneracy of the genetic code are also encompassed by the present invention.

Variations in the nucleotide sequence as set forth in SEQ ID NO:1 which are caused by point mutations or by induced modifications which enhance mlk receptor activity or mlk ligand binding activity, half-life or production level are also included in the invention.

The isolated polynucleotides of the invention may be operably linked to an expression control sequence such as the pMT2 or pED expression vectors disclosed in Kaufman et al., Nucleic Acids Res. 19, 4485-4490 (1991), in order to produce the mlk protein recombinantly. Many suitable expression control sequences are known in the art. General methods of expressing recombinant proteins are also known and are exemplified in R. Kaufman. Methods in Enzymology 185, 537-566 (1990). As defined herein "operably linked" means enzymatically or chemically ligated to form a covalent bond between the isolated polynucleotide of the invention and the expression control sequence, in such a way that the mlk protein is expressed by a host cell which has been transformed (transfected) with the ligated polynucleotide/expression control sequence.

A number of types of cells may act as suitable host cells for expression of the mlk protein. Any cell type capable of expressing functional mlk protein may be used. Suitable mammalian host cells include, for example, monkey COS cells, Chinese Hamster Ovary (CHO) cells, human kidney 293 cells, human epidermal A431 cells, human Colo205 cells, 3T3 cells, CV-1 cells, other transformed primate cell lines, normal diploid cells, cell strains derived from in vitro culture of primary tissue, primary explants, HeLa cells, mouse L cells, BHK, HL-60, U937, HaK, Rat2, BaF3, 32D, FDCP-1, PC12 or C2C12 cells.

The mlk protein may also be produced by operably linking the isolated polynucleotide of the invention to suitable control sequences in one or more insect expression

vectors, and employing an insect expression system. Materials and methods for baculovirus/insect cell expression systems are commercially available in kit form from, e.g., Invitrogen, San Diego, California, U.S.A. (the MaxBac® kit), and such methods are well known in the art, as described in Summers and Smith, Texas Agricultural Experiment Station Bulletin No. 1555 (1987), incorporated herein by reference. Soluble forms of the mlk protein may also be produced in insect cells using appropriate isolated polynucleotides as described above.

Alternatively, the mlk protein may be produced in lower eukaryotes such as yeast or in prokaryotes such as bacteria. Suitable yeast strains include *Saccharomyces cerevisiae*, *Schizosaccharomyces pombe*, *Kluyveromyces* strains, *Candida*, or any yeast strain capable of expressing heterologous proteins. Suitable bacterial strains include *Escherichia coli*, *Bacillus subtilis*, *Salmonella typhimurium*, or any bacterial strain capable of expressing heterologous proteins.

The mlk protein of the invention may also be expressed as a product of transgenic animals, e.g., as a component of the milk of transgenic cows, goats, pigs, or sheep which are characterized by somatic or germ cells containing a polynucleotide sequence encoding the mlk protein.

The mlk protein of the invention may be prepared by growing a culture transformed host cells under culture conditions necessary to express the desired protein. The resulting expressed protein may then be purified from the culture medium or cell extracts. Soluble forms of the mlk protein of the invention can be purified from conditioned media. Membrane-bound forms of mlk protein of the invention can be purified by preparing a total membrane fraction from the expressing cell and extracting the membranes with a non-ionic

detergent such as Triton X-100.

The mlk protein can be purified using methods known to those skilled in the art. For example, the mlk protein of the invention can be concentrated using a commercially available protein concentration filter, for example, an Amicon or Millipore Pellicon 5 ultrafiltration unit. Following the concentration step, the concentrate can be applied to a purification matrix such as a gel filtration medium. Alternatively, an anion exchange resin can be employed, for example, a matrix or substrate having pendant diethylaminoethyl (DEAE) groups. The matrices can be acrylamide, agarose, dextran, cellulose or other types commonly employed in protein purification. Alternatively, a cation exchange step can be employed. 10 Suitable cation exchangers include various insoluble matrices comprising sulfopropyl or carboxymethyl groups. Sulfopropyl groups are preferred (e.g., S-Sepharose[®] columns). The purification of the mlk protein from culture supernatant may also include one or more column steps over such affinity resins as concanavalin A-agarose, heparin-toyopearl[®] or Cibacrom blue 15 3GA Sepharose[®]; or by hydrophobic interaction chromatography using such resins as phenyl ether, butyl ether, or propyl ether; or by immunoaffinity chromatography. Finally, one or more reverse-phase high performance liquid chromatography (RP-HPLC) steps employing hydrophobic RP-HPLC media, e.g., silica gel having pendant methyl or other aliphatic groups, can be employed to further purify the mlk protein. Some or all of the foregoing purification steps, in 20 various combinations or with other known methods, can also be employed to provide a substantially purified isolated recombinant protein.

Preferably, the isolated mlk protein is purified so that it is substantially free of other mammalian proteins.

The mlk proteins of the present invention may also be used to identify and isolate mlk binding ligands. For example, mlk proteins having mlk ligand binding activity may be anchored to a solid support (such as in a microtiter plate or a binding affinity column) and exposed to possible sources of mlk ligands. Species binding to the mlk protein can then be eluted from the mlk protein and collected for further characterization. Sources of mlk binding ligands include among others blood, cerebrospinal fluid, extracted neuronal, muscular and splenic tissues, and membranes and conditioned media from cell lines derived from neuronal, muscular and hematopoietic tissue. mlk binding ligands may also be used in pharmaceutical compositions as described above with respect to the mlk protein. Ligands may also be identified in this manner which bind to the intracellular region of the mlk protein.

The invention also includes ligands which bind to the mlk receptor ("mlk receptor ligands"). The ligands may be growth factors that occur naturally in a mammal (either the same mammal or a different mammal from which the mlk receptor to which the ligand binds was isolated). The ligand may be isolated and purified, or be present on the surface of ligand-expressing cell populations. The ligand may also be a molecule that does not occur naturally in a mammal. The ligand may also be a non-protein molecule that acts as a ligand when it binds to or otherwise come into contact with, a mlk receptor protein. In cases where a ligand is a protein, polynucleotides encoding such ligands are also within the scope of the present invention. Once a protein ligand has been identified, the ligand-encoding polynucleotides may be obtained by expression cloning (Wong, Genetic Engineering, ed. by J.K. Setlow, 1990, Plenum Press, New York, vol. 12, p. 297) or by synthetic means.

The mlk proteins of the invention may also be used to screen for agents which are

capable of binding to mlk protein (either the extracellular or intracellular domains) and thus may act as inhibitors of normal ligand binding. Binding assays using a desired binding protein, immobilized or not, are well known in the art and may be used for this purpose using the mlk protein of the invention. Purified cell based or protein based (cell free) screening assays may 5 be used to identify such agents. For example, mlk protein may be immobilized in purified form on a carrier and binding to purified mlk protein may be measured in the presence and in the absence of potential inhibiting agents. A suitable binding assay may alternatively employ purified mlk protein immobilized on a carrier, with a soluble form of mlk protein of the invention. Any mlk protein exhibiting mlk ligand binding activity may be used in the screening 10 assays described above.

In such a screening assay, a first binding mixture is formed by combining a mlk binding ligand and mlk protein, and the amount of binding in the first binding mixture (B_0) is measured. A second binding mixture is also formed by combining a mlk binding ligand, mlk protein, and the compound or agent to be screened, and the amount of binding in the second 15 binding mixture (B) is measured. The amounts of binding in the first and second binding mixtures are compared, for example, by performing a B/B_0 calculation. A compound or agent is considered to be capable of inhibiting binding if a decrease in binding in the second binding mixture as compared to the first binding mixture is observed. The formulation and optimization 20 of binding mixtures is within the level of skill in the art, such binding mixtures may also contain buffers and salts necessary to enhance or to optimize binding, and additional control assays may be included in the screening assay of the invention.

Compounds found to reduce the binding activity of mlk protein to ligand to any

degree, preferably by at least about 10%, more preferably greater than about 50% or more, may thus be identified and then secondarily screened in other binding assays and *in vivo* assays. By these means compounds having inhibitory activity for mlk binding which may be suitable as therapeutic agents may be identified.

It is believed that the mlk receptor plays an important role in skeletal muscle function. As described below, mlk expression is localized in skeletal muscle, spleen and lung (see Northern blot reproduced in Fig. 3). Furthermore, murine mlk maps to the proximal arm of murine chromosome No. 4. A mutant murine strain mapping in this proximity, "vacillans" (vc), is characterized by half normal muscle mass, gait problems, lack of muscle coordination, slowed behavior and reflexes, metabolic abnormalities, mental deficiencies and drastic reduction of body fat (see, Sirlin, J. Genetics, 1956, 54, 42). By synteny, it is believed that human mlk will map to the p or q arm of human chromosome 9. It has been reported that a condition denominated Fukuyama congenital muscular dystrophy ("FCMD") maps to human chromosome 9q31-33 (Toda et al., Nature Genetics, 1993, 5, 283), the expected locus of human mlk. FCMD is characterized by involvement of facial muscle and the central nervous system, brain malformation, progressive muscular dystrophy, mental retardation, autosomally recessive inheritance and joint contractures (Osawa et al., Acta Paediatr. Jpn., 1991, 33, 261). Familial dysautonomia ("DYS"), or Riley-Day syndrome, has also been mapped to human chromosome 9q31-33 (Blumenfeld et al., Nature Genetics, 1993, 4, 160). This hereditary disease affects the development and survival of sensory, sympathetic and some parasympathetic neurons. DYS is characterized by neurological deficiency, with a range of other features including skeletal muscle abnormality. The similarity between the mlk receptor and the *Torpedo* RTK also points toward

muscular involvement, since the *Torpedo* RTK was isolated from the electric organ of electric rays which is homologous to muscle tissue. Each of these findings implicates mlk receptor in muscle biology, perhaps playing a role in synapse formation and function.

As a result, isolated mlk proteins and mlk receptor ligands may be useful in treatment of various medical conditions in which the mlk receptor is implicated or which are effected by the activity (or lack thereof) of the mlk receptor (collectively "mlk-related conditions"). Mlk-related conditions include without limitation muscle-related disorders, diseases of the nervous system (including infections), vascular disorders, trauma, metabolic derangements, demyelinating diseases (including multiple sclerosis), neuronal diseases (including Alzheimer's disease, Parkinson's disease and Huntington's chorea; and including motor neuron diseases such as amyotrophic lateral sclerosis, primary lateral sclerosis and Werdnig-Hoffmann disease), epilepsy, syringomyelia, peripheral neuropathy, congenital anomalies and tumors. Muscle-related conditions for treatment include without limitation muscular dystrophies (such as severe and benign X-linked muscular dystrophy, limb-girdle dystrophy, facioscapulohumeral dystrophy, myotonic dystrophy, distal muscular dystrophy, progressive dystrophic ophthalmoplegia, oculopharyngeal dystrophy and FCMD), DYS, congenital myopathy, myotonia congenita, familial periodic paralysis, paroxysmal myoglobinuria, myasthenia gravis, Eaton-Lambert syndrome, secondary myasthenia, and denervation atrophy. Given the importance of mlk RTK in muscle, perhaps especially in the establishment and function of synapses, it is also believed that the mlk protein and ligand will be of value in tissue repair.

It is also believed that the mlk receptor may play a role in the development and

growth of hematopoietic cells. As a result, mlk proteins and mlk receptor ligands may be useful in treatment of suppressed hematopoiesis, e.g., as a result of chemotherapy or associated with bone marrow transplantation. In addition, they may be useful for *in vitro* and *in vivo* stimulation of hematopoietic cells prior to transplantation, perhaps in peripheral stem cell transplantation.

5 Furthermore, they may act to modulate the differentiation and maturation of hematopoietic cells, including lymphocytes. Thus, they may be of value, for example, in stimulation of antigen-specific cytotoxic T-cell action.

In situ hybridization experiments have also detected expression of mlk in fetal bone. As a result, mlk proteins or mlk receptor ligands may also be useful for treatment of 0 various bone-related disorders, including without limitation those associated with bone loss (including that associated with osteoporosis, post-menopausal osteoporosis, senile osteoporosis, idiopathic osteoporosis, Pagets disease, multiple myeloma, and hypogonadal conditions). mlk proteins or mlk receptor ligands may also be useful as stimulators or inhibitors of osteoclasts and other cells involved in bone metabolism.

5 The mlk proteins or mlk receptor ligands may also be used to promote the growth of bone and cartilage and, therefore, have application in the healing of bone fractures and cartilage defects in humans and other animals. Such agents may have prophylactic use in closed as well as open fracture reduction and also in the improved fixation of artificial joints. De novo 0 bone formation induced by such an agent contributes to the repair of congenital, trauma induced, or oncologic resection induced craniofacial defects, and also is useful in cosmetic plastic surgery. These agents may also be used in the treatment of periodontal disease, and in other tooth repair processes. Such agents may provide an environment to attract bone-forming cells, stimulate

growth of bone-forming cells or induce differentiation of progenitors of bone-forming cells. A variety of osteogenic, cartilage-inducing and bone inducing factors have been described. See, e.g., European patent applications 148,155 and 169,016 for discussions thereof.

The proteins of the invention may also be used in wound healing and related tissue repair. The types of wounds include, but are not limited to burns, incisions and ulcers. (See, 5 e.g. PCT Publication WO84/01106 for discussion of wound healing and related tissue repair).

Isolated mlk proteins and mlk receptor ligands, purified from cells or recombinantly produced, may be used as a pharmaceutical composition when combined with a pharmaceutically acceptable carrier. Such a composition may contain, in addition to mlk protein 10 or ligand and carrier, diluents, fillers, salts, buffers, stabilizers, solubilizers, and other materials well known in the art. The term "pharmaceutically acceptable" means a non-toxic material that does not interfere with the effectiveness of the biological activity of the active ingredient(s). The characteristics of the carrier will depend on the route of administration. The pharmaceutical composition of the invention may also contain cytokines, lymphokines, or other hematopoietic 15 factors such as M-CSF, GM-CSF, IL-1, IL-2, IL-3, IL-4, IL-5, IL-6, IL-7, IL-8, IL-9, IL-10, IL-11, IL-12, IL-15, G-CSF, stem cell factor, and erythropoietin. The pharmaceutical composition may contain thrombolytic or anti-thrombotic factors such as plasminogen activator and Factor VIII. The pharmaceutical composition may further contain other anti-inflammatory agents. Such additional factors and/or agents may be included in the pharmaceutical composition 20 to produce a synergistic effect with isolated mlk protein or ligand, or to minimize side effects caused by the isolated mlk protein or ligand. Conversely, isolated mlk protein may be included in formulations of the particular cytokine, lymphokine, other hematopoietic factor, thrombolytic

or anti-thrombotic factor, or anti-inflammatory agent to minimize side effects of the cytokine, lymphokine, other hematopoietic factor, thrombolytic or anti-thrombotic factor, or anti-inflammatory agent.

The pharmaceutical composition of the invention may be in the form of a liposome in which isolated mlk protein or ligand is combined, in addition to other pharmaceutically acceptable carriers, with amphipathic agents such as lipids which exist in aggregated form as micelles, insoluble monolayers, liquid crystals, or lamellar layers which in aqueous solution.

Suitable lipids for liposomal formulation include, without limitation, monoglycerides, diglycerides, sulfatides, lysolecithin, phospholipids, saponin, bile acids, and the like.

Preparation of such liposomal formulations is within the level of skill in the art, as disclosed, for example, in U.S. Patent No. 4,235,871; U.S. Patent No. 4,501,728; U.S. Patent No. 4,837,028; and U.S. Patent No. 4,737,323, all of which are incorporated herein by reference.

As used herein, the term "therapeutically effective amount" means the total amount of each active component of the pharmaceutical composition or method that is sufficient to show a meaningful patient benefit, e.g., amelioration of symptoms of, healing of, or increase in rate of healing of such conditions. When applied to an individual active ingredient, administered alone, the term refers to that ingredient alone. When applied to a combination, the term refers to combined amounts of the active ingredients that result in the therapeutic effect, whether administered in combination, serially or simultaneously.

In practicing the method of treatment or use of the present invention, a therapeutically effective amount of isolated mlk protein or ligand is administered to a mammal. Isolated mlk protein or ligand may be administered in accordance with the method of the

invention either alone or in combination with other therapies such as treatments employing cytokines, lymphokines or other hematopoietic factors. When co-administered with one or more cytokines, lymphokines or other hematopoietic factors, isolated mlk protein or ligand may be administered either simultaneously with the cytokine(s), lymphokine(s), other hematopoietic factor(s), thrombolytic or anti-thrombotic factors, or sequentially. If administered sequentially, the attending physician will decide on the appropriate sequence of administering isolated mlk protein or ligand in combination with cytokine(s), lymphokine(s), other hematopoietic factor(s), thrombolytic or anti-thrombotic factors.

Administration of isolated mlk protein or ligand used in the pharmaceutical composition or to practice the method of the present invention can be carried out in a variety of conventional ways, such as oral ingestion, inhalation, or cutaneous, subcutaneous, or intravenous injection. Intravenous administration to the patient is preferred.

When a therapeutically effective amount of isolated mlk protein or ligand is administered orally, isolated mlk protein or ligand will be in the form of a tablet, capsule, powder, solution or elixir. When administered in tablet form, the pharmaceutical composition of the invention may additionally contain a solid carrier such as a gelatin or an adjuvant. The tablet, capsule, and powder contain from about 5 to 95% isolated mlk protein or ligand, and preferably from about 25 to 90% isolated mlk protein or ligand. When administered in liquid form, a liquid carrier such as water, petroleum, oils of animal or plant origin such as peanut oil, mineral oil, soybean oil, or sesame oil, or synthetic oils may be added. The liquid form of the pharmaceutical composition may further contain physiological saline solution, dextrose or other saccharide solution, or glycols such as ethylene glycol, propylene glycol or polyethylene glycol.

When administered in liquid form, the pharmaceutical composition contains from about 0.5 to 90% by weight of isolated mlk protein or ligand, and preferably from about 1 to 50% isolated mlk protein or ligand.

When a therapeutically effective amount of isolated mlk protein or ligand is administered by intravenous, cutaneous or subcutaneous injection, isolated mlk protein or ligand will be in the form of a pyrogen-free, parenterally acceptable aqueous solution. The preparation of such parenterally acceptable protein solutions, having due regard to pH, isotonicity, stability, and the like, is within the skill in the art. A preferred pharmaceutical composition for intravenous, cutaneous, or subcutaneous injection should contain, in addition to isolated mlk protein an isotonic vehicle such as Sodium Chloride Injection, Ringer's Injection, Dextrose Injection, Dextrose and Sodium Chloride Injection, Lactated Ringer's Injection, or other vehicle as known in the art. The pharmaceutical composition of the present invention may also contain stabilizers, preservatives, buffers, antioxidants, or other additive known to those of skill in the art.

The amount of isolated mlk protein or ligand in the pharmaceutical composition of the present invention will depend upon the nature and severity of the condition being treated, and on the nature of prior treatments which the patient has undergone. Ultimately, the attending physician will decide the amount of isolated mlk protein or ligand with which to treat each individual patient. Initially, the attending physician will administer low doses of isolated mlk protein or ligand and observe the patient's response. Larger doses of isolated mlk protein or ligand may be administered until the optimal therapeutic effect is obtained for the patient, and at that point the dosage is not generally increased further. It is contemplated that the various

pharmaceutical compositions used to practice the method of the present invention should contain about 0.1 µg to about 100 mg of isolated mlk protein or ligand per kg body weight.

The duration of intravenous therapy using the pharmaceutical composition of the present invention will vary, depending on the severity of the disease being treated and the condition and potential idiosyncratic response of each individual patient. It is contemplated that the duration of each application of the isolated mlk protein or ligand will be in the range of 12 to 24 hours of continuous intravenous administration. Ultimately the attending physician will decide on the appropriate duration of intravenous therapy using the pharmaceutical composition of the present invention.

Isolated mlk protein of the invention may also be used to immunize animals to obtain polyclonal and monoclonal antibodies which specifically react with the mlk protein and which may inhibit ligand binding to the mlk receptor. Such antibodies may be obtained using the entire mlk protein as an immunogen, or by using fragments of mlk protein such as the soluble mature mlk protein. Smaller fragments of the mlk protein may also be used to immunize animals. The peptide immunogens additionally may contain a cysteine residue at the carboxyl terminus, and are conjugated to a hapten such as keyhole limpet hemocyanin (KLH). Additional peptide immunogens may be generated by replacing tyrosine residues with sulfated tyrosine residues. Methods for synthesizing such peptides are known in the art, for example, as in R.P. Merrifield, J.Amer.Chem.Soc. 85, 2149-2154 (1963); J.L. Krstenansky, et al., FEBS Lett. 211, 10 (1987).

Neutralizing or non-neutralizing antibodies (preferably monoclonal antibodies) binding to mlk protein or mlk ligand may also be useful therapeutics for certain tumors and also

in the treatment of conditions described above. These neutralizing monoclonal antibodies are capable of blocking the ligand binding to the mlk protein.

Example 1

5

Isolation of Murine mlk cDNA

A fragment of the murine mlk cDNA was isolated using PCR amplification of first strand cDNA with primers specific to conserved motifs of receptor tyrosine kinases. Bone marrow from C57BL/6J mice treated two days previously with 150 mg/kg 5-fluorouracil was depleted of B220+, Gr1+, CD3+ and Mac1+ cells. and then the cells bearing the Sca+ 10 antigen were isolated by fluorescence-activated cell sorting (FACS). Total cellular RNA was purified from the sorted cells using the acid phenol technique.

First strand cDNA was synthesized using random hexamer primers and Moloney murine leukemia virus reverse transcriptase (Perkin Elmer GeneAmp RNA PCR reagents). The PCR scheme used to isolate the murine cDNA is summarized in Fig. 2. The cDNA was 15 amplified using the primers of SEQ ID NO:3 and SEQ ID NO:4. The SEQ ID NO:3 and SEQ ID NO:4 primers were directed to the IHRDL and SDVWS motifs, respectively. The reaction was carried out in a Perkin Elmer 9600 Thermal Cycler, using the following conditions: 94°C for 30 sec., 37°C for 15 sec., 72°C for 15 sec. (5 cycles); 94°C for 30 sec., 50°C for 15 sec., 72°C for 15 sec. (25 cycles).

20 The product of this amplification was purified by Centricon 30 microcentrifugation (Amicon), and then amplified again using the primers of SEQ ID NO:5 and SEQ ID NO:6, directed to the DLAAR and WLALES motifs, respectively. The reaction was carried out under

the conditions described above.

The second primers contained EcoRI sites at their 5' ends to facilitate sub-cloning. Thus, the products of the second reaction were digested with EcoRI, and examined by gel electrophoresis using low melting temperature agarose and ethidium bromide staining. the 5 approximately 150 bp band expected was excised and eluted. The isolated fragments were ligated into EcoRI digested pBluescript KSII+ (Stratagene), and used to transform competent InvαF' E. coli (Invitrogen). Transformants were selected on L-amp plates containing 100 µg/ml ampicillin, and then randomly selected for miniplasmid preparations and analysis by nucleotide sequencing.

10 The motifs of the first PCR are highly conserved in protein tyrosine kinases (Hanks and Quinn, Methods in Enzymol., 1991, 200, 38) and this amplification selects for a population of cDNAs derived from cytosolic and receptor tyrosine kinases. The motifs of the second PCR are specific to RTKs. Analysis of products of the second PCR amplification showed this strategy to be successful. No cytosolic tyrosine kinases were obtained. However, 15 previously described RTKs, such as flk-1, flk-2 and c-kit, were found. The sequence of one transformant was found to be novel and not previously described.

Longer cDNA clones of this novel sequence, including pred2#2 (SEQ ID NO:1), were obtained from a murine embryo (day 15) cDNA library in the lambda SHlox vector obtained from Novagen (Madison, WI). This library was hybridized with an oligonucleotide 20 probe derived from the novel transformant (SEQ ID NO:7), which was radiolabelled with gamma-³²P-ATP. pred2#2 was deposited as an EcoRI/HindIII insert in pSHlox (Novagen, Wisconsin) with ATCC on July 20, 1994 as accession number 69659.

Example 2Localization of mlk Expression

Expression of mlk mRNA is examined by Northern blot hybridization analysis of RNA isolated from primary tissues and cell lines. Cellular RNA is isolated by conventional techniques such as acid phenol isolation, guanidinium thiocyanate denaturation/density gradient centrifugation in cesium chloride or RNA Stat-60 isolation (Tel-Test Inc., TX). The mRNA fraction is selected on the basis of binding to oligo dT₁₂₋₁₈, using either oligo dT-cellulose chromatography, or binding to oligo dT-biotin and then magnetic separation after binding to streptavidin-paramagnetic particles (Promega, Inc., WI). RNA is exposed to formaldehyde-agarose gel electrophoresis and then transferred to nitrocellulose or nylon membranes by capillary blotting. Northern blot filters of murine and human tissue RNAs can also be purchased from Clontech, CA.

The first northern blot analysis of murine tissue RNAs was carried out with a murine mlk cDNA probe labelled with α -³²P-dCTP by random hexamer priming and the Klenow fragment of *E. coli* DNA polymerase I. Two mRNA species were found to hybridize to this probe, of approximately 7.0 and 4.0 kb. Both mlk mRNAs were detected in spleen and lung poly A⁺ RNA, and at higher levels in skeletal muscle poly A⁺ RNA. Subsequent northern blot experiments have not detected expression of mlk mRNAs in spleen or lung tissue and have confirmed high levels of mlk expression in skeletal muscle.

Analysis of mlk mRNA expression by northern blot in murine embryo polyA⁺ RNA revealed that mlk is expressed at least as early as day 7 after fertilization.

Expression of mlk mRNA is also examined in tissue sections or whole mount

embryos by *in situ* hybridization with radiolabelled or chemically modified RNA probes. Antisera against mlk protein are generated by immunization of rabbits, mice, hamsters, goats or sheep with synthetic mlk peptides, such as the C-terminal 12-20 residue peptide conjugated to carrier. Antibodies against the extracellular portion of mlk are obtained by immunization with recombinant fusion proteins such as mlk-thioredoxin, mlk-maltose-binding protein, mlk-glutathione-S-transferase. These antibodies are used to localize mlk protein by immunohistochemistry. Antibodies against the extracellular region of mlk are used to isolate mlk expressing cells, *e.g.*, from bone marrow or muscle, by fluorescence-activated cell sorting, in conjunction with a secondary antibody that recognizes the primary anti-mlk, and is conjugated to a fluorochrome such as phycoerythrin or fluorescein isothiocyanate. Using additional antibodies conjugated to fluorochromes against known cell surface markers in conjunction with the anti-mlk protein will permit a phenotyping of the subsets of cells expressing mlk.

The expression of mlk polypeptide is also examined by immunoprecipitation and *in vitro* kinase assay. Cell or tissue extracts are prepared in 1% (v/v) Nonidet P-40, 10% (v/v) glycerol, 150 mM sodium chloride, 20 mM Tris-HCl pH 8.0, or alternatively in 1% (v/v) Nonidet P-40, 1% (w/v) sodium deoxycholate, 0.1% (w/v) SDS, 25 mM Tris-HCl pH 8.0, 150 mM sodium chloride. Both solutions are supplemented with 1 mM sodium vanadate, 1 µg/ml leupeptin, 1 mM Pefabloc SC, 1 µg/ml aprotinin. Antisera raised against the C-terminal mlk peptide and protein A-Sepharose are then used to precipitate the mlk polypeptide. The immunoprecipitate is washed three times in the above extraction buffer, then three times in kinase assay buffer (20 mM HEPES, pH 7.3, 10 mM manganese chloride, 5 mM magnesium chloride) and then resuspended in 50 µl kinase assay buffer containing 2 µl of γ -³²P-ATP (10

μ Ci/ μ l; 1,000 Ci/mmol). After incubation for 15 minutes, the immunoprecipitate is washed three times in 20 mM HEPES, pH 7.3, 5 mM ethylene glycol-bis(β -amino-ethyl-ether) N,N,N',N'-tetraacetic acid (EGTA), 1mM rATP, and then boiled for 5 minutes in 1% SDS, 100 mM Tris-HCl pH 6.8, 50 μ l/ml β -mercaptoethanol, prior to SDS-PAGE electrophoresis and 5 autoradiography..

Example 3

Chromosomal Mapping of Murine mlk

Murine mlk was chromosomally mapped by single-strand conformation 10 polymorphism analysis (Beier, Mammalian Genome, 1993, 4, 627) using the following oligonucleotides:

- 1F: CAGACTGTGAGCTGGAGGAAC (SEQ ID NO:8)
- 1R: GGATTATGTAGGAACGTAACC (SEQ ID NO:9)
- 2F: CGAAATAGGTTGGAGATAACAGG (SEQ ID NO:10)
- 15 2R: CGTGTCTTGACTGGTGGAAAGAAGG (SEQ ID NO:11).

The murine mlk gene was mapped genetically by SSCP analysis in the BxD recombinant inbred (R1) series. The murine mlk gene was mapped to the proximal arm of murine chromosome 4. By synteny, this region is predicted to correspond to human chromosome 9, p or q.

20

Example 4

Assay for mlk Receptor Activity

Cells expressing mlk protein are used in tyrosine phosphorylation assays for mlk receptor activity. NIH 3T3 or Rat2 cells are stably transfected with mlk expression plasmids. For 12-24 hours prior to the assay, the cells are maintained under standard growth conditions, except that only 0.5% fetal bovine serum is used in the culture medium. Monolayers of these 5 cells, or suspensions prepared by detachment of cells by brief treatment with 20 mM EGTA in PBS, are stimulated for 5 min. at 37°C with ligand or antibodies directed to the extracellular region. Cells are then pelleted, and solubilized in either ice-cold 1% (v/v) Nonidet P-40, 1% (w/v) sodium deoxycholate, 0.1% (w/v) SDS, 25 mM Tris-HCl pH 8.0, 150 mM sodium chloride, or ice-cold 1% (v/v) Nonidet P-40, 10% (v/v) glycerol, 20 mM Tris-HCl pH 8.0, 150 10 mM sodium chloride. Both extraction buffers are supplemented with 1 mM sodium vanadate, 1 μg/ml leupeptin, 1 μg/ml aprotinin, 1 mM Pefabloc SC.

The solubilized proteins are then immunoprecipitated with rabbit antibodies directed against the mlk protein, such as the C-terminal peptide epitope, followed by protein A-sepharose. The immunoprecipitated material is then exposed to reducing SDS-PAGE 15 electrophoresis and transferred to a nitrocellulose filter by Western blotting.

The amount of phosphotyrosine in the immunoprecipitated mlk protein is then assayed by incubation of the filter with a monoclonal antibody specific for phosphotyrosine (e.g., the 4G10 monoclonal antibody available from Upstate Biotechnology, New York). The antibody is either directly conjugated to horseradish peroxidase, or used as a biotin conjugate, followed 20 by incubation with streptavidin-horseradish peroxidase. Binding is visualized with enhanced chemiluminescence reagents (commercially available from Amersham, Illinois) and exposure to x-ray film.

An increase in phosphotyrosine in samples treated (e.g., with a potential ligand source) relative to samples treated only with fresh medium, are taken to indicate induction of receptor activity. Positive samples can be further studied by examining the time course of phosphotyrosine induction on the mlk polypeptide.

5 Induction of phosphotyrosine on mlk protein can also be examined by immunoprecipitation with anti-phosphotyrosine conjugated to agarose, followed by Western blotting with anti-phosphotyrosine, or Western blotting of whole cell extracts with anti-phosphotyrosine.

10 Techniques for the study of phosphotyrosine on proteins have been described (Cooper et al., Methods in Enzymol., 1983, 99, 387).

Example 5

Assay for mlk Ligand Binding Activity

15 Binding of the mlk ligand to the extracellular region of the mlk receptor protein will specifically cause a rapid induction of phosphotyrosine on the receptor protein. Assays for ligand binding activity as measured by induction of phosphorylation is described in Example 4.

Activation of the receptor by ligand binding can also be determined by measuring cell growth or differentiation. For example, NIH 3T3 or Rat2 fibroblasts are stably transfected with expression vectors directing synthesis of mlk protein. A mitogenic response in these 20 transfected cells as a result of ligand binding is measured by examining their growth in semi-solid medium, as described for other RTKs expressed in transfected NIH 3T3 or Rat2 cells (Cordon-Cardo et al., Cell. 1991, 66 173; Glass et al., Cell. 1991, 66, 405; Dosil et al., Mol.

Cell Biol., 1993, 13, 6572; Maroc et al., Oncogene, 1993, 8, 909). In the presence of binding ligand, these cells will acquire the ability to grow in semi-solid media.

Induction of growth can also be measured by examining c-fos induction. The 3T3 or Rat2 cells are placed in 0.5% fetal bovine serum in DMEM for 24 hours prior to ligand addition. Addition of ligand or serum (positive control) will cause an induction of expression of the c-fos immediate response gene. Samples are harvested at zero time (prior to ligand addition), 30 min., 1 hour, 2 hours and 3 hours after ligand or serum addition. Cells harvested are used to isolate total cellular RNA, which is then examined by Northern blot analysis with a c-fos cDNA probe.

Alternatively, a soluble form of the mlk extracellular region is produced and used to detect ligand binding. A DNA construct is prepared in which the extracellular region encoding the mlk cDNA (truncated prior, preferably immediately prior, to the predicted transmembrane domain) is ligated in frame to a cDNA encoding the hinge C_H2 and C_H3 domains of a human immunoglobulin (Ig) γ 1. This construct is generated in an appropriate expression vector for COS cells, such as pEDAC or pMT2. The plasmid is transiently transfected into COS cells. The secreted mlk-Ig fusion protein is collected in the conditioned medium and purified by protein A chromatography.

The purified mlk-Ig fusion protein is used to demonstrate ligand binding in a number of applications. The soluble ligand can be coated onto the surface of an enzyme-linked immunosorbent assay (ELISA) plate, and then additional binding sites blocked with bovine serum albumin or casein using standard ELISA buffers. The mlk-Ig fusion protein is then bound to the solid-phase ligand, and binding is detected with a secondary goat anti-human Ig conjugated

to horseradish peroxidase. The activity of specifically bound enzyme can be measured with a colorimetric substrate, such as tetramethyl benzidine and absorbance readings.

The mlk ligand may also be expressed on the surface of cells, for example by possessing a transmembrane domain or glucosyl phosphatidyl inositol (GPI) linkage. Cells expressing the membrane bound ligand can be identified using the mlk-Ig fusion protein. The soluble mlk-Ig fusion is bound to the surface of these cells and detected with goat anti-human Ig conjugated to a fluorochrome, such as fluorescein isothiocyanate and flow cytometry.

Other mlk proteins may be tested for mlk ligand binding activity by forming expression of such other proteins as Ig fusion proteins as described herein.

10

Example 6

Isolation of Full-Length Murine mlk cDNA

The 5' end of the murine mlk can be isolated from random hexamer primed cDNA libraries. Murine skeletal muscle or whole embryo (day 15 post-fertilization) RNA is prepared and used to synthesize double-stranded cDNA. Priming of first strand cDNA with random hexamers rather than oligo dT₁₂₋₁₈ will ensure the representation of the 5' end of mlk in the library. The cDNA can be ligated with Eco RI adaptors and cloned into an EcoRI digested bacteriophage λ vector such as λ ZIPLOX (Gibco-BRL, MD) or λ ZAPII (Stratagene, CA). The resulting plaques can be screened with a radiolabelled synthetic oligonucleotide probe, derived from the 5' end of the available partial cDNA sequence. Alternatively, the library can be screened with a 300-400 bp restriction fragment from the 5' end of the available cDNA.

A murine Balb/c strain skeletal muscle cDNA library (oligo dT and random

hexamer primed) in λgt 10 was used (purchased from Clontech, CA; catalog number ML 3006a). A 5' fragment of pred2#2 was isolated using PCR with primers:

5' ACACTGCGTGGAAATGAGCTGA 3' (SEQ ID NO:16) and

5' AAATATGGCAGTCTTGTGCA 3' (SEQ ID NO:17). This isolated PCR fragment was 5 labelled with α-³²P-dCTP and the Klenow fragment of DNA polymerase I with random hexamer priming. The labelled fragment was used to screen the λgt 10 skeletal muscle library by hybridization at high stringency. Single hybridizing bacteriophage were purified. Lambda DNA was purified with Wizard Lambda reagents (Promega, WI), and digested with EcoRI. An EcoRI insert fragment was subcloned into pBluescriptIIKS+ (Stratagene, CA), and examined by 10 nucleotide sequencing. A cDNA clone called "5'mlk #3" was identified by this method. The nucleotide sequence of 5'mlk#3 is provided as SEQ ID NO:14. The amino acid sequence encoded thereby is provided as SEQ ID NO:15.

5'mlk#3 was deposited as an EcoRI insert in pBluescriptIIKS+ with ATCC on January 11, 1995 as accession number 69741.

15 5'mlk#3 is a partial cDNA for the full length mlk RTK which includes the 5' end. The 5'mlk#3 sequence and previous red2#2 sequence overlap in a region of the extracellular region in juxtaposition to the transmembrane domain. The overlap region runs from about amino acids 331-478 of SEQ ID NO:15 (5'mlk#3) and from about amino acids 1-140 of SEQ ID NO:2 (red2#2).

20 Alignment of the sequences reveals a 24 bp nucleotide insertion of 5'mlk#3 that is not present in red2#2. This insert encodes an additional 8 amino acids in frame (amino acids 454-461 of SEQ ID NO:15). The first residue after the insert (amino acid 462 of SEQ ID

NO:15) also differs from that of red2#2 (amino acid 124 of SEQ ID NO:2). Thus, there are two isoforms of the mlk RTK, which are designated as "mlk-1" and "mlk-2", which differ by not containing or containing this insert, respectively. Similar isoforms of the KIT and TRK A RTKs have been described in the literature (Crosier et al., Blood, 1993, 82, 1151; Reith et al., EMBO J., 1991, 10, 2451; Barker et al., J. Biol. Chem., 1993, 268, 15150)). Differences in the isoforms may relate to ligand binding, receptor dimerization or activation.

Full-length cDNAs for both isoforms are made by ligating portions of the 5' mlk#3 and red2#2 sequences. Briefly, both cDNAs are cleaved at the same point in the region of the sequence overlap with an appropriate restriction enzyme. The 3' end of the 5' mlk#3 fragment containing the 5' end of the entire mlk coding sequence is then ligated to the 5' end of the red2#2 fragment containing the 3' end of the entire mlk coding sequence.

The nucleotide and amino acid sequences for full-length mlk-1 isoform are provided at SEQ ID NO:18 and SEQ ID NO:19, respectively. The nucleotide and amino acid sequences for full-length mlk-2 isoform are provided at SEQ ID NO:20 and SEQ ID NO:21, respectively. In SEQ ID NO:21 (mlk-2), the 8 amino acid insert is found at amino acids 454-461 and amino acid 462 is a threonine residue (the corresponding residue in SEQ ID NO:19 (mlk-1) is alanine).

Table 1 identified the locations of the mlk protein domains in various forms of mlk protein identified herein. Domains are identified by reference to amino acid numbers in the indicated sequences. The location of the leader sequence and transmembrane domains was predicted using computer sequence analysis algorithms (leader sequence: Von Heijne, 1987. Sequence Analysis in Molecular Biology: Treasure Trove or Trivial Pursuit (New York:

Academic Press); transmembrane domain: Klein et al., 1985, *Biochim. Biophys. Acta.* 815, 468).

5

Table 1
Identification of mlk Protein Domains

10

	SEQ ID NO:2	SEQ ID NO:15	SEQ ID NO:19	SEQ ID NO:21
leader	N/A	1-21	1-21	1-21
extracellular	1-156	22-478	22-486	22-494
transmembrane	157-177	N/A	487-507	495-515

15

Example 7

Isolation of Human mlk cDNA

The human mlk cDNA can be isolated by cross-hybridization with the murine mlk cDNA. There is a high degree of cross-species sequence conservation between RTK genes, especially in the region encoding the kinase domain. An example is the similarity between murine mlk and the *Torpedo* RTK cDNA sequences (see Fig. 1). The *Torpedo* RTK nucleotide and amino acid sequences are reported as SEQ ID NO:12 and SEQ ID NO:13, respectively. Human cDNA libraries in appropriate bacteriophage λ vectors such as λ ZAPII can be hybridized with mlk cDNA probes. These libraries can be purchased from Stratagene, California and Clontech, California. The commercially available libraries include human muscle cDNA libraries that would be expected to be a good source. If necessary, the complete human

mlk gene can be isolated from human genomic libraries. Such genomic clones would also provide ideal probes for screening human cDNA libraries at high stringency.

The human cDNA libraries are hybridized with a high specific activity ^{32}P -labelled mlk cDNA probe at low stringency ($6 \times \text{SSC}$, 0.1% SDS; 45°C) for 36-48 hours using 5 approximately $2 \times 10^6 \text{ cpm/ml}$ of probe. The plaque DNA is immobilized on nitrocellulose filters, with approximately 20,000 plaques per 137 mm plate. After the hybridization, the filters are washed in four changes of $4 \times \text{SSC}$, 0.1% SDS at room temperature over 90 minutes, with gentle rotation. Then, the filters are placed in $4 \times \text{SSC}$, 0.1% SDS at 55°C for 30 minutes. The filters are air dried and exposed to x-ray film with two intensifying screens at -80°C, for 10 24-72 hours. Positive plaques are isolated, re-plated and screened by hybridization until a single, pure recombinant bacteriophage plaque that hybridizes to the probe is isolated, and then analyzed by nucleotide sequencing.

The stringency of the hybridization and filter washing may be increased or decreased to optimize signal detection and signal to background ratio. The exact conditions for 15 cross-hybridization of murine mlk cDNA annealing to the human mlk sequence may also be refined by examining the hybridization of the radiolabelled mlk probe to human genomic DNA Southern blots. Identical Southern blot filters containing *Eco* RI and *Hind* III digested human genomic DNA are hybridized at $5 \times \text{SSC}$, 0.1% SDS at 45°C, and then washed in $5 \times \text{SSC}$, 0.1% SDS at room temperature for 90 minutes. A range of different washing stringencies are 20 then employed over a range of SSC concentrations and temperature conditions. Each wash includes 0.1% SDS, and is carried out for 30 minutes (two changes). In this way, optimal conditions can be found, and then used for cDNA library screening.

An alternative way of isolating the human mlk cDNA is to amplify a portion of it with degenerate primers based on homologies inferred from alignment of murine mlk and *Torpedo* RTK. The template for this PCR amplification is first strand cDNA synthesized from human poly A⁺ RNA (purchased from Clontech, CA) bacteriophage λ cDNA libraries or human genomic DNA (Promega, WI). The resulting PCR product is cloned and sequenced, and then represents a probe for hybridizing human cDNA and genomic libraries at high stringency. The unique sequence can also be used to isolate the remainder of the human mlk cDNA by 5' or 3' anchored PCR (Loh et al., *Science*, 1989, 243, 217; Ohara et al., *Proc. Natl. Acad. Sci. USA*, 1989, 86, 5673; reviewed in Arnheim et al., *Annu. Rev. Biochem.*, 1992, 61, 131).

10

Example 8

Expression of Murine and Human mlk cDNA

The mlk-1 cDNA is ligated into the pcDNA3 expression vector (Invitrogen, CA), such that the mlk coding region was under the control of the CMV promoter. This vector also 15 contains an SV40 origin, and can be used as a replicating vector in COS cells. COS cells are transiently transfected with pcDNA3/mlk-1 or as negative controls: an expression vector for Flt4 or no DNA ("mock").

After 48 hours, cell lysates are prepared in ice-cold 1% (v/v) Nonidet P-40, 20 mM Tris-HCl pH 8.0, 150 mM sodiumchloride, 10% (v/v) glycerol, 1 mM sodium vanadate, 20 1 μg/ml leupeptin, 1 mM Pefabloc SC, 1 μg/ml aprotinin, and then exposed to reducing SDS-PAGE, and transferred to a nitrocellulose filter by western blotting. The filter is blocked with 5% (w/v) non-fat dried milk, 0.1% Tween 20 in TBS (20mM Tris-HCl pH 7.5, 150 mM sodium

chloride) overnight at 4°C. The filter is washed in TBS/0.3% Tween 20, and incubated for 1 hr. at ambient temperature with rabbit antisera against the C-terminal mlk peptide. Then the filter is washed in TBS/0.3% Tween 20 and TBS/0.1% Tween 20. Binding of the antisera is detected with goat anti-rabbit IgG conjugated to horseradish peroxidase. After additional 5 washing, the localized peroxidase is detected with Amersham enhanced chemiluminescence reagents and x-ray film.

The mlk protein may also be expressed as follows:

The mlk cDNA is ligated into a number of mammalian cell expression vectors. For transient expression in COS cells, the mlk cDNA is cloned into pED or related plasmids that 10 place the cDNA under the control of the adenovirus major late promoter with SV40 enhancer and origin, and adenovirus VA RNA genes. The same vector is used for gene amplification in Chinese hamster ovary cells (*dhfr*-), using the linked *DHFR* gene to co-amplify mlk expression with selection in reiteratively increasing concentrations of methotrexate (Kaufman, Methods in Enzymol., 1990, 185, 537).

15 Expression in cell lines such as factor-dependent BaF3, 32D and FDCP-1, and in PC12 and C2C12 is obtained with cytomegalovirus immediate early, Rous sarcoma virus long terminal repeat, or β -actin promotor sequences. Examples of such vectors are pcDNA3 (Invitrogen, CA) and pDR2 (Clontech, CA). Stable transfectants are selected with G418 or hygromycin B, using *neo*^R or *hyg B* marker genes incorporated into the expression vectors.

20 Expression of the RTK is monitored by Northern Blot analysis or ribonuclease protection assay of cellular RNA from transfectants. Antibodies to the murine or human protein can also be prepared and used to examine expression, by immunoprecipitation of biosynthetically

radiolabelled cell extracts, Western blot analysis of cell extracts, or flow cytometry.

Example 9

Identification of mlk Binding Ligands

5 A number of techniques can be employed to isolate mlk ligand cDNA. Whether the ligand protein is secreted from the cell in a soluble form, or associated with the cell membrane by means of a transmembrane domain, GPI-linked anchor or heparin binding, will determine which route is most successful.

10 Soluble ligands are detected in the conditioned media of cell lines. The conditioned media is concentrated by Amicon centriprep units 10-100x, and then used to stimulate proliferation of the BaF3 or other factor-dependent cell lines stably transfected with mlk receptor protein expression vectors. Proliferation can be measured by the incorporation of ³H-thymidine. Positive signals in this assay are dissected using neutralizing antibodies to known growth factors, to ensure the response is due to the novel mlk ligand. Other confirmatory data 15 may then be sought. For example, the conditioned media may be used to assay for phosphotyrosine induction on the mlk receptor (see assay above).

15 In addition to cells transfected with a mlk receptor protein expression vector, other chimeric receptors may be used. For example, a strong proliferative signal is induced in cells such as BaF3 by hematopoietin receptor family members. The extracellular region of the EGF 20 RTK has been fused to the transmembrane and intracellular region of the erythropoietin receptor (EPO-R) (Pacific et al., J. Biol. Chem., 1994, 269, 1571). In 32D cells, this fusion receptor gives a strong proliferation signal to EGF, that is better than that in cells transfected with vectors

encoding the complete EGF RTK. A mlk extracellular region/EPO-R transmembrane-intracellular region fusion functions similarly in 32D and BaF3 cells, and is used for screening conditioned media for the mlk ligand.

The ligand cDNA from a cell line is isolated by either expression cloning or
5 protein purification. A cDNA library is made from polyA+ RNA from the cell line. For expression cloning, this cDNA is ligated into an efficient COS cell expression vector, such as pXM or pED, and is transformed into *E. coli* DH10B cells (Gibco-BRL) by electroporation. Pools of plasmid transformants (approximately 100-2000) are plated individually on 100 mM L-amp plates. Copies are made on nitrocellulose filters. One copy is soaked in glycerol, and is
10 used to cryopreserve the transformants at -80°C. An additional copy is used to make a plasmid DNA preparation from the pool. Such plasmids are transfected transiently into COS cells using DEAE-dextran, and after 48-72 hr. the COS conditioned media are screened on the bioassay. Once a positive pool is identified, the frozen copy is used to isolate the single positive plasmid by a process of subdivision and grid formation.

15 The ligand can also be purified using the extracellular region of the receptor. The mlk extracellular region is fused in frame to the hinge-C_H2-C_H3 regions of human immunoglobulin (Ig) γ 1, and is cloned into pED Δ C. Using transient expression in COS cells, or selection and amplification in stably transfected CHO cells, the soluble mlk-Ig fusion is produced. It is purified from conditioned media using protein A-chromatography. The mlk Ig
20 fusion is then coupled to resins and used to affinity purify the mlk ligand. Other purifications steps such as reverse phase or ion exchange chromatography may also be used.

The purified ligand protein is analyzed for amino acid sequence, and the resulting

data is used to design degenerate oligonucleotide primers. These primers are used to screen a cDNA library from the cell line source, either by hybridization in the presence of tetramethyl ammonium chloride, or by PCR.

Membrane-associated mlk ligands are isolated by a different procedure. The mlk-
5 Ig fusion is used to screen for cell lines expressing the mlk ligand. The mlk-Ig fusion is either per-complexed with protein A-FITC, or bound to the cell surface and then detected in a second staining with goat $F_{(ab')2}$ anti-human Ig-FITC (Southern Biotechnology Associates, Alabama). Binding is detected by flow cytometry. A cDNA library from the cell line source is prepared in the pXM or pEDAC vectors for expression in COS cells. The ligand cDNA can then be
10 isolated by COS transfection, staining with mlk-Ig:protein A-FITC pre-complexed material, and sorting the brightest population of transfected COS cells, e.g., with a Becton-Dickinson FACS Star. Plasmid DNA is rescued from this brightest population of COS cells by the Hirt procedure (Hirt, J. Mol. Biol., 1967, 26, 365), or by an alkaline-SDS mini-plasmid preparation combined with a phenol/chloroform extraction. Plasmid DNA is transformed into *E. coli* DH10B, a large
15 scale plasmid isolation is then carried out and re-transfected into COS cells. By re-iteratively following this selection procedure, the mlk ligand cDNA is enriched (Yamasahi et al., Science, 1988, 241, 825; Rice et al., Cytometry, 1991, 12, 221). After 3-5 rounds of selection, individual plasmids are analyzed by transfection and mlk-Ig binding. Alternatively, the transfected COS cells are enriched for the mlk ligand by "panning" (Seed et al., Proc. Natl.
20 Acad. Sci. USA, 1987, 84, 3365; Aruffo et al., Proc. Natl. Acad. Sci. USA, 1987, 84, 8573), or by magnetic particle separation (Padmanabhan et al., Analytical Biochem., 1988, 170, 341).

Expression libraries are also transfected into COS cells. The subpopulation of

cells expressing the membrane-bound mlk ligand is identified by staining with mlk-Ig and rabbit anti-human Ig conjugated to alkaline phosphatase and visualized with an insoluble alkaline phosphatase substrate, such as NBT/BCIP (Promega, WI). The positive cell population is scraped from the plate, plasmid is recovered and re-transfected in E. coli, and then transfected 5 into COS cells for rescreening. In this way, single cDNAs expressing the mlk ligand can be isolated. This *in situ* staining technique can also be used to identify pools of clones containing the ligand cDNA, and then the specific clone isolated by reiterative partition and screening of the pool. By permeabilization of the cell membrane, the mlk-Ig can be used to stain for intracellular mlk ligand in the secretory pathway.

What is claimed is:

1. An isolated polynucleotide comprising a nucleotide sequence selected from the group consisting of:
 - (a) the nucleotide sequence of SEQ ID NO:1 from nucleotide 13 to nucleotide 1602;
 - (b) the nucleotide sequence of SEQ ID NO:18 from nucleotide 1 to nucleotide 2580;
 - (c) the nucleotide sequence of SEQ ID NO:20 from nucleotide 1 to nucleotide 2604;
 - (d) a nucleotide sequence capable of hybridizing to a nucleic acid sequence specified in (a)-(c);
 - (e) a nucleotide sequence varying from the sequence of a nucleotide sequence specified in (a)-(c) as a result of degeneracy of the genetic code; and
 - (f) an allelic variant of a nucleotide sequence specified in (a)-(c).
2. The polynucleotide of claim 1 wherein said nucleotide sequence encodes for a protein having an activity selected from the group consisting of mlk receptor activity and mlk ligand binding activity.
3. The polynucleotide of claim 1 wherein said nucleotide sequence is operably linked to an expression control sequence.

4. The polynucleotide of claim 1 which encodes a murine mlk protein.
5. The polynucleotide of claim 1 which encodes a human mlk protein.
6. The polynucleotide of claim 1 comprising the nucleotide sequence of SEQ ID NO:1 from nucleotide 13 to nucleotide 1602.
7. The polynucleotide of claim 1 encoding the protein of claim 14.
8. The polynucleotide of claim 1 comprising the nucleotide sequence of SEQ ID NO:18 from nucleotide 1 to nucleotide 2580.
9. The polynucleotide of claim 1 comprising the nucleotide sequence of SEQ ID NO:20 from nucleotide 1 to nucleotide 2604.
10. The polynucleotide of claim 2 which encodes a protein having mlk ligand binding activity.
11. A host cell transformed with the polynucleotide of claim 3.
12. The host cell of claim 11, wherein said cell is a mammalian cell.

13. A process for producing a mlk protein, said process comprising:
- (a) growing a culture of the host cell of claim 11 in a suitable culture medium; and
 - (b) purifying the mlk protein from the culture.
14. An isolated mlk receptor protein comprising an amino acid sequence selected from the group consisting of:
- (a) the amino acid sequence of SEQ ID NO:2;
 - (b) the amino acid sequence of SEQ ID NO:2 from amino acids 1 to 156;
 - (c) the amino acid sequence of SEQ ID NO:2 from amino acids 157 to 177;
 - (d) the amino acid sequence of SEQ ID NO:2 from amino acids 178 to 530;
 - (e) the amino acid sequence of SEQ ID NO:2 from amino acids 242 to 517;
 - (f) the amino acid sequence of SEQ ID NO:15;
 - (g) the amino acid sequence of SEQ ID NO:15 from amino acids 22 to 478;
 - (h) the amino acid sequence of SEQ ID NO:19;
 - (i) the amino acid sequence of SEQ ID NO:19 from amino acids 22 to 486;
 - (j) the amino acid sequence of SEQ ID NO:19 from amino acids 487 to 507;
 - (k) the amino acid sequence of SEQ ID NO:19 from amino acids 508 to 860;
 - (l) the amino acid sequence of SEQ ID NO:19 from amino acids 572 to 847;
 - (m) the amino acid sequence of SEQ ID NO:21;
 - (n) the amino acid sequence of SEQ ID NO:21 from amino acids 22 to 494;
 - (o) the amino acid sequence of SEQ ID NO:21 from amino acids 495 to 515;

- (p) the amino acid sequence of SEQ ID NO:21 from amino acids 516 to 868;
 - (q) the amino acid sequence of SEQ ID NO:21 from amino acids 580 to 855;
 - (r) fragments of (a)-(q) having mlk receptor activity; and
 - (s) fragments of (a)-(q) having mlk ligand binding activity.
15. The protein of claim 14 comprising the amino acid sequence of SEQ ID NO:2.
16. The protein of claim 14 comprising the amino acid sequence of SEQ ID NO:15.
17. The protein of claim 14 comprising the amino acid sequence of SEQ ID NO:19.
18. The protein of claim 14 comprising the amino acid sequence of SEQ ID NO:21.
19. The protein of claim 14 comprising a fragment having mlk ligand binding activity.
20. A pharmaceutical composition comprising a mlk protein of claim 14 and a pharmaceutically acceptable carrier.
21. A mlk protein produced according to the process of claim 13.
22. A composition comprising an antibody which specifically reacts with a mlk protein of claim 14.

23. A method of identifying a mlk receptor ligand, said method comprising:
 - (a) providing a sample containing a potential source of mlk ligand;
 - (b) contacting said sample with a protein of claim 14; and
 - (c) collecting materials binding to said protein.
24. A mlk receptor ligand.
25. The ligand of claim 24 identified according to the method of claim 23.
26. A pharmaceutical composition comprising a ligand of claim 24 and a pharmaceutically acceptable carrier.
27. An isolated polynucleotide encoding a ligand of claim 24.
28. A host cell transformed with an expression vector comprising the polynucleotide of claim 27.
29. A method of treating a mlk-related condition, said method comprising administering a therapeutically effective amount of a composition of claim 20 to a mammalian subject.
30. A method of inhibiting binding of a ligand to a mlk protein, said method comprising administering a therapeutically effective amount of a composition of claim 20.

31. A method of treating a mlk-related condition, said method comprising administering a therapeutically effective amount of a composition of claim 26 to a mammalian subject.

32. A method of inhibiting binding of a ligand to a mlk protein, said method comprising administering a therapeutically effective amount of a composition of claim 26.

33. A method of identifying an inhibitor of ligand binding to mlk protein which comprises:

(a) combining a mlk protein of claim 14 with a ligand, said combination forming a first binding mixture;

(b) measuring the amount of binding between the mlk protein and the mlk in the first binding mixture;

(c) combining a compound with the mlk protein and the ligand to form a second binding mixture;

(d) measuring the amount of binding in the second binding mixture; and

(e) comparing the amount of binding in the first binding mixture with the amount of binding in the second binding mixture;

wherein the compound is capable of inhibiting ligand binding to mlk protein when a decrease in the amount of binding of the second binding mixture occurs.

34. An inhibitor identified by the method of claim 33.

35. A pharmaceutical composition comprising the inhibitor of claim 34 and a pharmaceutically acceptable carrier.
36. A method of treating a mlk-related condition, said method comprising administering a therapeutically effective amount of a composition of claim 35 to a mammalian subject.
37. A method of inhibiting binding of a ligand to a mlk protein, said method comprising administering a therapeutically effective amount of a composition of claim 35.
38. A composition comprising an antibody which specifically reacts with a ligand of claim 24.
39. A method of promoting bone or cartilage growth, said method comprising administering a therapeutically effective amount of a composition of claim 20 or 26.
40. A method of inhibiting bone or cartilage growth, said method comprising administering a therapeutically effective amount of a composition of claim 20 or 26.
41. A method of inhibiting bone loss, said method comprising administering a therapeutically effective amount of a composition of claim 20 or 26.

INTERNATIONAL SEARCH REPORT

International	Application No
PCT/US 95/08493	

A. CLASSIFICATION OF SUBJECT MATTER			
IPC 6	C12N15/12	C07K14/705	C07K16/18
			A61K38/17

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 6	C12N	C07K
-------	------	------

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP,A,0 599 274 (SQUIBB BRISTOL MYERS CO) 1 June 1994 see abstract; example 5.7 8 9; table II ---	24-28,38
A	PNAS, vol. 90, 1993 pages 2895-2899, C.G.B.JENNINGS ET AL. 'Muscle-specific trk-related receptor with a kringle domain defines a distinct class of receptor tyrosine kinases' see the whole document ---	1-19

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents :

- *'A' document defining the general state of the art which is not considered to be of particular relevance
- *'E' earlier document but published on or after the international filing date
- *'L' document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *'O' document referring to an oral disclosure, use, exhibition or other means
- *'P' document published prior to the international filing date but later than the priority date claimed

- *'T' later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *'X' document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *'Y' document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *'Z' document member of the same patent family

INTERNATIONAL SEARCH REPORT

International application No.

PCT/US 95/08493**Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)**

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.: **29-32, 36-37, 39-41**
because they relate to subject matter not required to be searched by this Authority, namely:
Remark: Although these claims are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the composition.

2. Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:

3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
 No protest accompanied the payment of additional search fees.
